

Candidate Login & Sign-Up — Automated Testing Summary

Mankind Pharma iTAP Candidate Portal — Sign-In & Sign-Up (Create New Account) Pages

Prepared: 17 August 2026
Prepared by: QA Automation Team

What We Did

The candidate portal already had automated tests for the basic "everything works" path of signing up and signing in. Our work extended this to cover what happens when things *don't* go perfectly — wrong passwords, invalid data, edge cases, and a "Forgot Password" flow that had no coverage at all — and, in the process of building that coverage, uncovered two real defects in the existing automation that were fixed.

Test Coverage Delivered

34 test scenarios were identified, documented, and categorized in **Login Page Test Cases.xlsx**:

The one remaining scenario (opening the Sign-Up form) isn't a standalone test, but it runs automatically as a setup step inside nearly every other test, so it's exercised on every single run regardless.

Real Issues Found & Fixed

Issue	What Was Happening	Resolution
Sign-in success was never verified	The automation would attempt to sign in and then just carry on with the next steps, without ever checking that the sign-in had actually succeeded. A silent failure here would go unnoticed until much later steps failed for confusing, unrelated reasons.	FIXED Added a real, explicit check that sign-in landed on the correct page before continuing.
"Switch to Sign-In" button was silently broken	The link that lets a candidate switch from the Sign-Up form back to Sign-In was being clicked in a way that, due to a visual overlap with another on-screen element, never actually registered. The existing test around it happened to check a different element that was visible either way, so it never noticed.	FIXED Corrected the click method, and corrected the test so it actually verifies the switch happened.
Wrong "success" page title used in checks	Multiple checks were written against a page title that doesn't actually appear after a successful sign-up or sign-in — the real title differs. These checks would have failed the very first time they were properly exercised.	FIXED Corrected the expected title across every check that used it.
"Forgot password?" had zero test coverage	This link existed on the Sign-In page but nothing in the automation ever interacted with it.	ADDED Full coverage added, including confirming the app correctly distinguishes between a registered and an unregistered account.

New Coverage Added

- Forgot Password flow** — registered account, unregistered account, and blank-submission cases
- Input length limits** — confirms Aadhaar Number, Email, Password, and Manager Reference ID all correctly enforce their maximum lengths, including via paste

- **Accidental double-clicks** — confirms rapidly double-clicking Sign Up or Sign In doesn't break the flow or create duplicate activity
- **Simultaneous duplicate sign-ups** — confirms that if two people tried to sign up with the same Aadhaar Number at the same moment, only one account is created
- **A genuine usability finding**: the Aadhaar Number field does not trim accidental leading/trailing spaces, which can silently cut off part of the real number instead of being cleaned up. Recommended for the product team's awareness.

Why This Matters

- Two real defects were caught and fixed before they could cause confusing failures elsewhere in the pipeline.
- The candidate-facing entry point to the entire hiring process is now verified against realistic failure scenarios, not just the ideal case.
- Future changes to these pages can be re-tested in minutes instead of requiring manual re-checking.

Deliverables

- **Login Page Test Cases.xlsx** — full documented test case matrix with results
- **Updated automation code** — `pages/ITAP_LoginPage.js`, `pages/ITAP_AlreadySignedUserPage.js`, `tests/CandidateSignupValidation.spec.js`, `tests/CandidateSignInValidation.spec.js`

Automated with Playwright against the live candidate portal (fcadmin100-dev environment). All findings in this report were confirmed by direct observation of the application, not assumed.
